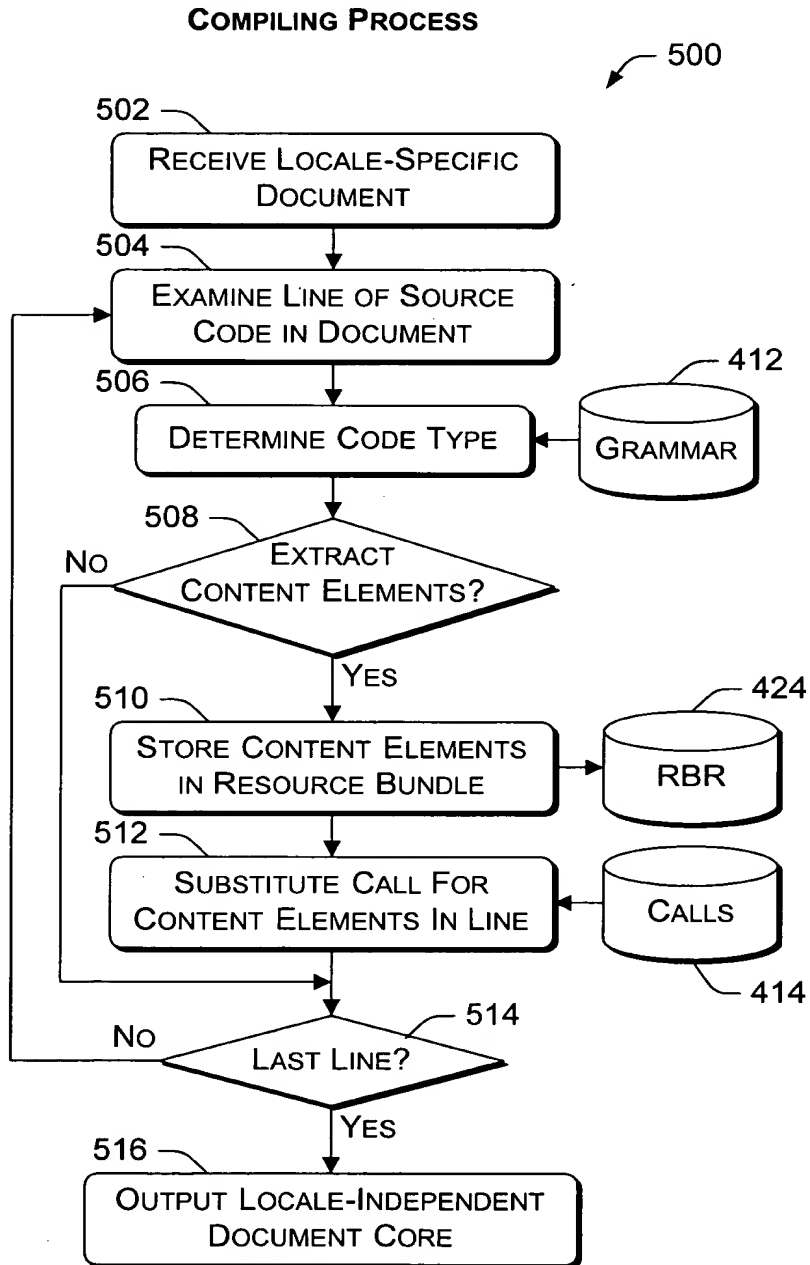

Fig. 5

FIG. 6 is a block diagram of a system 600 for localizing server applications. The system 600 includes an application data manager 240, a resource bundle repository 424, and a resource bundle manager 602. The application data manager 240 is connected to the resource bundle repository 424 and the resource bundle manager 602. The resource bundle repository 424 stores resource bundles for different locales. The resource bundle manager 602 manages the resource bundles and provides them to the application data manager 240. The application data manager 240 provides the resource bundles to the server applications. The server applications use the resource bundles to display text strings in the user's language.
